Proposal for File Review and Analysis

Please let us know in the Instagram chat if this is acceptable or if you want to see changes or if you want a completely different way to proceed - this is only a proposal.

As we move forward with our assignment, to ensure that each data file we are working with is properly verified and cleaned for use, and with the fact that not all of us have experience in this process, I would like to propose the following approach:

1. **File Allocation:** At this time Matthew Madriaga has assigned us each a file or multiple files.
2. **Individual Assessment:** To provide us a better opportunity to succeed, We recommend that we move the meeting from Friday to Monday. In doing so we would like to have you loading your assigned files into R, create a dataframe with the data, and saving it back into a second file. Please follow the guidelines below:

A. **Start:** Do a `git pull`

B. **File Naming Convention:**

- Name your R script as follows: `000_initialise-<initials>.R`.
- Replace `<initials>` with your initials. Note that when you do a `git pull` an example of this is in the `r-code` folder, `000_dummy_DE.R`.

C. **Data Loading and Saving:**

- Save your assigned file into `data` folder. You will be the only one to do this.
- Load your assigned file into R using `read.csv()` or an appropriate function based on the file format.
- create a dataframe.
- Save the dataframe data back to a new file in the same format as the original. The naming convention for the cleaned file should be: `YYYYMMDD.clean-<original-file-name>`. For example, if the original file is `dummy-data.csv`, the cleaned file should be named: `20240925.clean-dummy-data.csv`.

D. **Commit and Push:**

Once your script and 'cleaned' data file are ready, commit them to the GitHub repository. Ensure you are committing to the correct branch and avoid conflicts with other team members' work.

E. **Documentation:**

Include a brief documentation section in your R script

3. **Team Review:** On Monday, both Ann and myself for entry in Trello. This meeting will allow us to collectively assess the condition of each file and develop a plan for data cleaning and preparation. The aim is to ensure that no one person is overwhelmed with the task of addressing all data issues.
4. **Shared Responsibility:** While the initial investigation of each file is the responsibility of the assigned team member, it is important to know that resolving these issues will be a collaborative effort. After our review, we will decide as a team how best to distribute the remaining work.

Please let us know in the Instagram chat if this is acceptable or if you want to see changes or if you want a completely different way to proceed - this is only a proposal.
